

Intrusion Detection in Industrial Control System Using Machine Learning

Abstract:

These days mostly all the countries depend on Critical Infrastructure (CI) like Electrical Power and Water Treatment Plant, so it is critical for us that we take appropriate measures to protect these CI from cyber-attacks.

The methodology of this paper is to create rules that govern the physical behavior of a process within a plant. Rules that we generate are also called Invariants. Two approaches can be used to generate rules, data-centric (DaC) or a design-centric approach (DeC). A DaC is used in this project to derive rules by using the dataset of an electric power testbed called Electrical Power and Intelligent System (EPIC).
